Landsat 8 and Sentinel-2

- Launched in 2013 (L8), 2015 (S2A) and 2017 (S2B)
- High spatial resolution: 30 m (L8) 10-60 m (S2)
- Revisit time of 16 days (L8), 10 days (S2), 5 days with S2A+S2B
 - and overlapping orbits at higher latitudes
- VIS/NIR spectral coverage, including SWIR bands for A/C

DSF

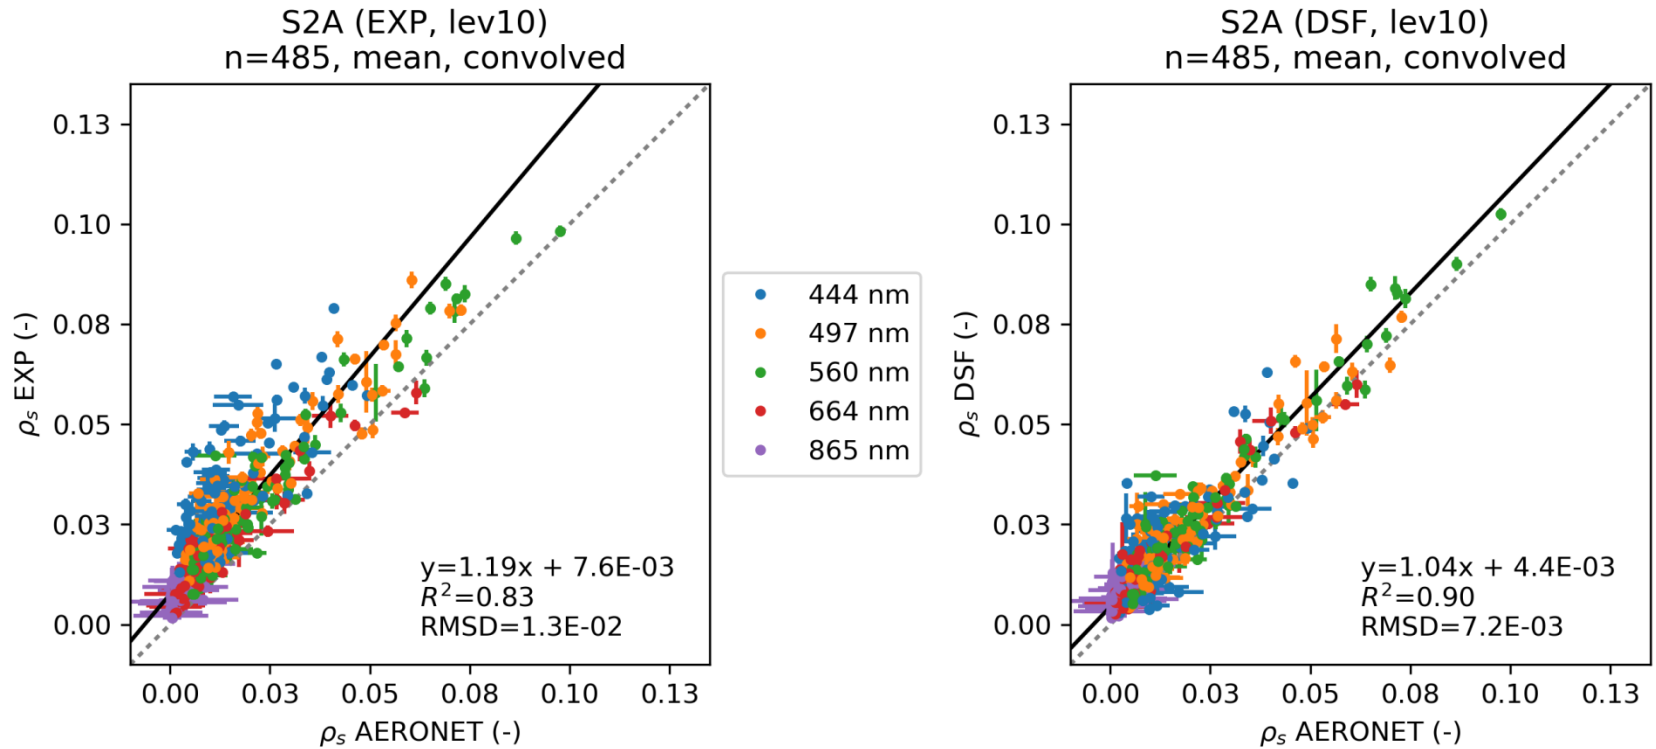

Validation

EXP or DSF?

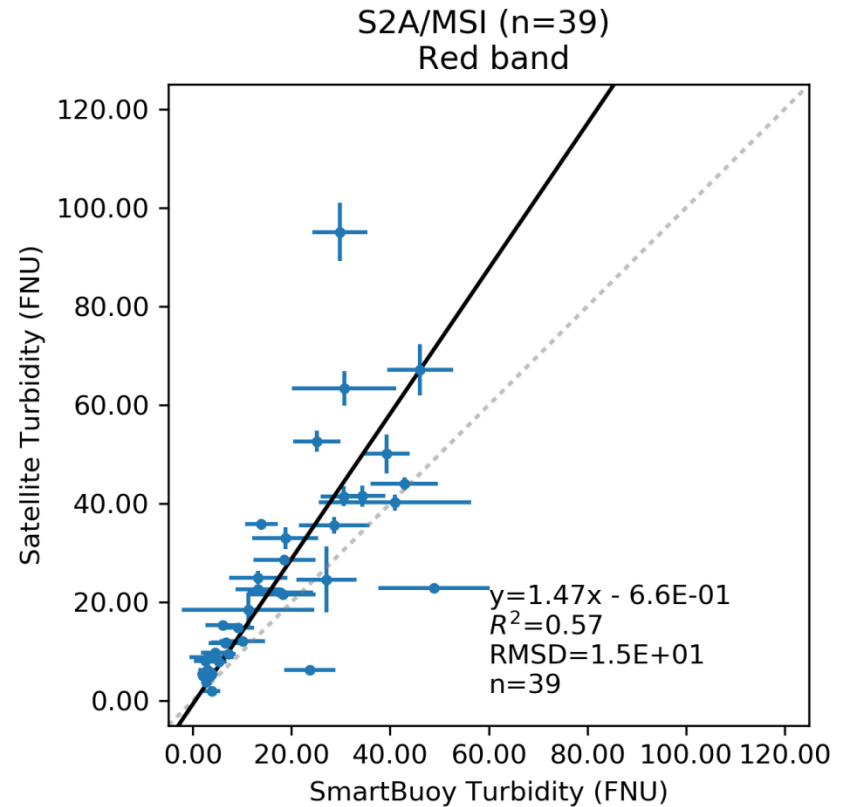

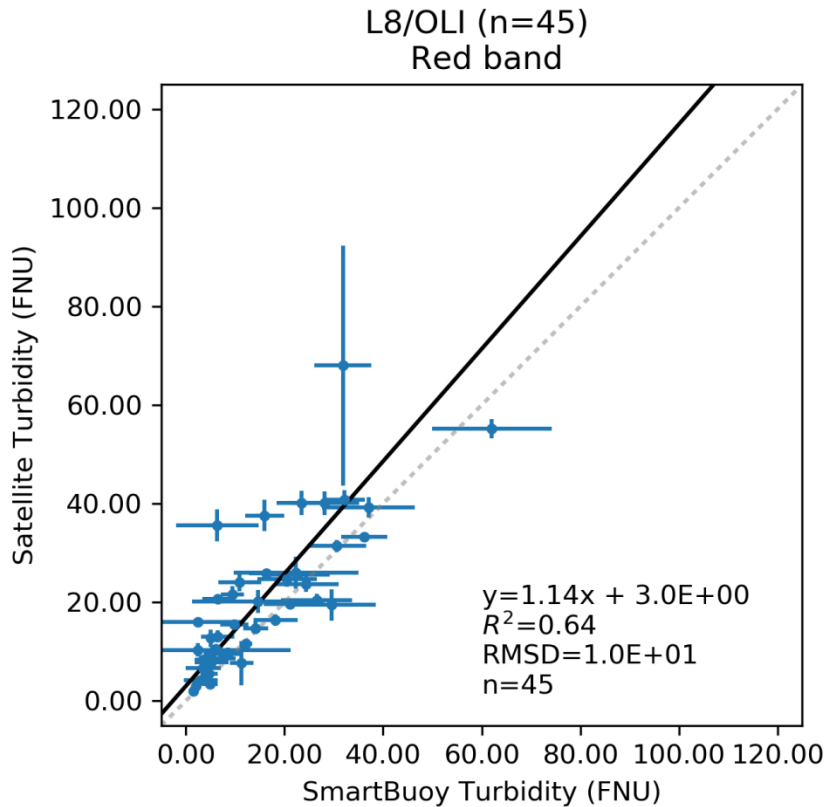

Using all global AERONET-OC sites

EXP or DSF?

Using all global AERONET-OC sites

Turbidity

Using CEFAS Warp Smartbuoy data

Conclusions

- “New” processes can be observed with high spatial resolution Landsat & Sentinel-2 data, for example sediment transport around ports and offshore constructions, and dredging activities
- Sentinel-2 has a red-edge band, allowing for the estimation of chlorophyll a absorption in the red band, and hence chlorophyll a concentration
- SWIR bands are very useful for atmospheric correction in turbid coastal waters, but may be sensitive to glint and adjacency effects
- Even though the satellites are designed for land applications, accurate coastal and inland water reflectances are obtained using the DSF atmospheric correction algorithm
